FL-01: Draw the Path – Portfolio Planning and Validation

1. Introduction

This report documents my portfolio planning activity for Week-01. The goal was to define a clear portfolio claim, identify the desired recruiter action, create a simple sitemap, configure AI tools, and validate the sitemap using a Claude Project pressure-test.

2. Portfolio Claim and Desired Action

My portfolio is designed to demonstrate practical AI/ML and NLP skills through real projects and documented learning progress. The primary action I want visitors to take is to contact me for AI/ML internship opportunities.

3. Portfolio Sitemap

The sitemap consists of Home, AI/ML Projects, About Me, Resume, and Contact. Each page supports the portfolio claim and guides recruiters toward the desired action.

4. AI Toolkit Setup

I verified access to ChatGPT, Claude, Gemini, and Perplexity and prepared them for portfolio planning and learning activities.

5. Claude Project Configuration

Project Name: AI Portfolio Builder & Internship Preparation. The project was configured to act as a tutor and portfolio reviewer with custom instructions.

6. Sitemap Pressure-Test

Claude reviewed the sitemap against the portfolio claim and desired recruiter action, identifying strengths and areas for improvement.

7. Changes I Will Make

I will add a visible skills section, improve GitHub and LinkedIn visibility, use project case studies, and strengthen calls-to-action.

8. Conclusion

This activity helped me create a focused portfolio structure aligned with my AI/ML internship goals.

Sitemap Pressure-Test

Let's run this through the 5-question framework you asked me to use every time.

1. Does the sitemap support your claim?

Partially. Your claim has three components: (a) CS student, (b) practical AI/ML skills, (c) NLP specifically, all (d) proven through real projects.

Here's the problem: right now, only one page ("AI/ML Projects") carries the weight of proving all of that. That's a lot of pressure on one page, and your sitemap gives me no evidence yet about:

Depth vs. breadth — Are these class assignments or self-directed projects with real datasets/deployment?

NLP specifically — Nothing in the sitemap signals NLP work distinctly. If a recruiter skims your nav bar, they see "AI/ML Projects" — generic. Your claim promises NLP; your structure doesn't visibly deliver on it.

Skills stack — There's no page or section listing tools (Python, PyTorch, Hugging Face, scikit-learn, SQL, etc.). Recruiters often scan for keywords before reading anything.

Teaching point: A portfolio claim should be provable within 10 seconds of landing on the Home page — not after clicking into a sub-page. Right now, your Home page's job (based on the sitemap alone) is unclear. Is it a landing page with a pitch + featured work? Or just a hub of links? That distinction matters a lot.

2. Does it encourage the desired action (recruiter contact)?

Weakly. You have a "Contact" page, but here's the issue: recruiters rarely browse multiple pages. Many will glance at your Home page and GitHub/LinkedIn (if linked) and decide in under a minute whether to go further.

If "Contact" is buried as a separate nav item, you're relying on the recruiter to want to click it — but nothing in your sitemap tells me your Home, Projects, or About pages actively push toward that action (e.g., a visible "Let's talk" CTA, email button, or resume download on every page).

Teaching point: In UX/conversion terms, this is called CTA placement. A single Contact page is a "destination" CTA. What you want is a "persistent" CTA — visible in the header/footer on every page — so the action is always one click away, no matter where the visitor lands.

3. What's missing?

A visible tech/skills stack — even a simple list (Python, PyTorch, scikit-learn, spaCy/Hugging Face, SQL, Git) dramatically increases keyword-matchability for recruiters and ATS-adjacent skimming.

GitHub link, prominently placed — for AI/ML roles, many recruiters and hiring managers check GitHub before or instead of a portfolio site. If it's not front and center, you're losing credibility fast.

Project depth structure — your sitemap shows "AI/ML Projects" as one item, but doesn't tell me if each project page explains: the problem, your approach, the result/metric, and a link to code. Without that structure, projects read as a list, not evidence.

Signal of momentum — something like "Currently learning: Transformers" or "Currently building: X" on the Home page. Students without work experience benefit a lot from showing they're actively growing, not just displaying finished work.

Resume accessibility — is "Resume" a page with an embedded PDF, or just a download link? Both work, but it needs to be viewable and downloadable, not one or the other.

4. What can be removed?

Honestly — nothing needs to be cut at this stage. Four to five pages is already lean and appropriate for a student portfolio. The problem isn't clutter, it's thinness: each page needs more targeted content, not more pages. Adding random extra pages (a "Skills" page, a "Blog"

page) is optional, but I'd lean toward folding skills into Home/About rather than fragmenting your site further — fewer clicks to the evidence is usually better.

5. Specific improvements

Area Change

Home Add a one-line pitch, 2–3 featured projects (not the full list), visible tech stack, and a persistent CTA (email/LinkedIn/GitHub icons in header)

AI/ML Projects Structure each project as: Problem → Approach → Result (with a number/metric if possible) → Code link. Tag projects by category (NLP, CV, Classical ML) so "NLP" from your claim is visibly backed

About Me Keep it short, but tie your story back to why AI/ML — avoid generic "I'm passionate about technology" language

Resume Make it viewable inline + downloadable

Contact Fine as-is, but don't rely on it being the only CTA — repeat CTA across pages

GitHub If not already linked prominently, this is your highest-priority fix

Strengths

Clean, minimal sitemap — no wasted or confusing navigation.

Claim is specific (CS student + AI/ML + NLP + real projects), which is good; specificity is more credible than vague claims like "passionate about AI."

Structure maps to a standard, recruiter-familiar portfolio pattern (easy to navigate).

Weaknesses

The claim (especially the NLP part) isn't visibly backed by the sitemap's structure — it relies entirely on content you haven't shown me yet.

No persistent, low-friction path to the desired action (contact) — it's isolated to one page.

No visible skills/tech stack or GitHub presence in the sitemap — both are high-signal for ML recruiters.

Unclear whether "AI/ML Projects" page shows depth (approach/results) or just a list of titles/links.

Recommended Changes

Add a visible skills/tech stack section (Home or About).

Make GitHub and LinkedIn persistent (header/footer), not buried.

Restructure each project entry as Problem → Approach → Result → Code link.

Tag/categorize projects so NLP work is explicitly visible, not implied.

Turn Home into a "pitch + proof" page: one-liner claim, 2–3 featured projects, CTA.

Next Action

Share your current project list (titles + one-line descriptions) with me. I'll walk through each one using the same 5-question framework — what claim it makes, what evidence backs it, and whether it's strong enough to keep, rework, or cut. This will tell us if your "real projects" actually prove your claim, or if we need to identify gaps (especially in NLP) to fill next.
